

Time Delay Device Files Documentation

Alex Striff & Lucas Illing

October 7, 2019

All of the documentation concerning the auxilliary files for the project is assembled here. What follows is a description of the contents of each directory.

- **arduino:** The code uploaded to the Arduino Due.
- **doc:** The top-level documentation directory (this one).
- **fifo-p3f:** The KiCAD files for the device, as well as a schematic PDF and the gerber files that I sent for manufacture.
- **figures:** The images and GNUPlot code used to create the figures for the paper.¹
- **program-rescaling:** The code used to calculate the gain and offset resistor values to be optimal, given the constraints of E-series values and the overall resistances needed.

¹*Spumpus* stands for spiky lumpus, where *lumpus* refers to a lumpy-looking signal. We want a strange signal for the programming to demonstrate that it is really *arbitrary*.
